IN THE CLAIMS

- 1. (Original) A method for developing an Enterprise JavaBean (EJB) component, comprising the steps of:
 - (a) analyzing a business domain to determine functional requirements of said business domain;
 - (b) transforming said functional requirements into an EJB component model; and
 - (c) building an EJB component in accordance with said EJB component model that encompass the business functionality of said business domain.
- 2. (Original) The method of claim 1, further comprising the steps of:

 modifying said functional requirements by a user; and
 repeating the steps (b) and (c) to provide a parallel development process.
- 3. (Original) The method of claim 1, wherein said EJB components are extensible and configurable.
- 4. (Original) The method of claim 1, wherein said functional requirements include data and process model of said business domain.
- 5. (Original) The method of claim 4, wherein said EJB component model encapsulates the data and process model of the said business domain.
- 6. (Original) The method of claim 1, wherein the step of analyzing includes the step of generating a list of inputs, each input identifying a resource that relate to said business domain.
- 7. (Original) The method of claim 6, further comprising the step of generating eFunction matrix from said list of inputs.

25517697.1

- 8. (Original) The method of claim 1, wherein the step of transforming transforms said functional requirements using an unified modeling language (UML) tool to generate said EJB component model.
- 9. (Original) The method of claim 8, wherein said EJB component model includes a plurality of EJB classes.
- 10. (Original) The method of claim 9, wherein the step of building builds said EJB component from at least one of the following class stereotypes: Belonging, Session, Entity, Configurable Entity, Business Policy and Workflow.
- 11. (Original) The method of claim 1, wherein the step of transforming includes the step of mapping eXtensible Markup Language (XML) to said EJB component model.
- 12. (Original) The method of claim 1, wherein the step of analyzing includes the step of dividing said business domain into one or more sub-domains and determining functional requirements for each of said sub-domains; and wherein the step of transforming transforms each of said functional requirements for said sub-domains into said EJB component model.
- 13. (Original) The method of claim 1, wherein the step of building includes the step of generating relational mappings and deployment descriptors.
- 14. (Original) The method of claim 1, wherein the step of building includes the steps of:

generating end-user documentation; developing unit tests to test said EJB component; and generating a reference implementation of said EJB component.

15. (Original) The method of claim 14, further comprising the step of verifying said end-user documentation to said EJB component.

THEOR 205.1 US (10107436)

- 16. (Original) The method of claim 14, further comprising the step of packaging said EJB component for deployment with container managed persistence.
- 17. (Original) The method of claim 1, wherein said EJB component is a Smart component having at least one of following Smart feature: SmartKey, SmartHandle and SmartValue.
- 18. (Original) The method of claim 16, wherein said Smart component is an eBusiness Smart component.
